

## **Skill Creator mode complete.**

I (with full team collaboration from Benjamin, Harper, and Lucas) inspected your existing skills under `/home/workdir/.grok/skills/`, identified the three incomplete stubs that still carried the literal TODO placeholders required by the skill format, and completed them by extracting, specializing, and tightening content from the mature sibling skills.

This is exactly the intended use of the skill-creator workflow: derive clean, focused, executable new skills from material that already exists in the corpus rather than inventing from scratch or duplicating model knowledge.

## **What was completed**

Three specialized skills were written (overwriting the TODO stubs), validated with the official `validate-skill.sh` script, and confirmed free of the forbidden front-matter characters (`:`, `<`, `>`). Each follows the established house style of your other Brudo skills (Purpose → Core law/definitions → Workflow → JSON Output Contract → Anti-Patterns → Relationship/Resources).

### **1. `/brudo-promotion-asymmetry`**

#### **Description**

Detect and operate on promotion–demotion asymmetry under lexical pressure. Promotion expands nodes with anatomy objects mechanisms measurements dependencies. Demotion atomizes them into labels endpoints neighbors residual categories. Trigger on promotion expands, demotion atomizes, promotion asymmetry, promotion–demotion, or when scoring how term–family members gain or lose internal structure under rewrite pressure.

#### **Derived from**

Core law + pressure-dimension #7 + transformation families in `brudo-lexitek`.

#### **Specialization focus**

Makes the single most important asymmetry law (“Promotion expands; demotion atomizes”) the primary object of analysis and reporting, rather than one of seven co-equal pressure scores.

### **2. `/brudo-coordinate-class-break`**

#### **Description**

Detect and operate on coordinate-class breaks and repairs that hide class breaks. Identify taxonomy-to-process conversion hub absorption surface-peer divergence horizontal rank leakage and lexical-overlap repairs that mask object replacement. Trigger on class break, coordinate class, repair that hides, class-break detection, or when a rewrite preserves surface form but changes membership executable type or underlying question.

### **Derived from**

The six named transformation families + Closed-Loop Map Interrogation + claim-ladder/HER rules in `brudo-lexitek` (and cross-links to `brudo-map-interrogation`).

### **Specialization focus**

Surfaces true class membership or executable-type changes that surface form or slot-count preservation would otherwise hide.

### **3. /brudo-fwocr**

### **Description**

Apply the FWOCR master work-energy ledger for Breath-Year accounting in respiratory adaptation analysis. Track functional work oxygen cost recovery as burden decomposition across the Conditioning Tree under Hannah's Law. Trigger on FWOCR, Breath-Year, energy ledger, burden decomposition, Functional Work Oxygen Cost Recovery, work-energy accounting, or when quantifying cumulative airway work recovery savings or load without treating it as a settled caloric theorem.

### **Derived from**

Ontology definitions, accounting rules, and output contracts in `respiratory-adaptation-canon` + `brudo-respiratory-adaptation` (FWOCR = Functional Work / Oxygen / Cost / Recovery ledger; burden decomposition, never a settled caloric theorem).

### **Specialization focus**

Gives the FWOCR ledger its own first-class skill so Breath-Year accounting can be invoked cleanly without loading the entire respiratory-adaptation kernel every time.

## **Design decisions & nuances**

- **Progressive disclosure respected** — Each new skill stays concise (≈56–65 lines) and inherits the heavy reference material (pressure-schema, transformation-families, claim-ladder, HER rules, ontology, method-order) from the parent skills rather than copying it.
- **No invented knowledge** — Every definition, anti-pattern, and workflow step is lifted or tightly specialized from existing archive-native text.
- **Output contracts stay machine-usable** — All three emit the same style of JSON objects already used by the parent skills so downstream WORK\_PANEL / AUTHORIZED\_INITIATIVE / claim-ledger tooling continues to interoperate.
- **Trigger language is exhaustive but non-overlapping** — The descriptions were written so the three new skills fire on the precise phrases that previously fell through to the broader parent skills.
- **Validation passed** — `bash /root/.grok/skills/skill-creator/scripts/validate-skill.sh` reports OK for all three.

## How to use them immediately

Simply invoke by name:

- `/brudo-promotion-asymmetry`
- `/brudo-coordinate-class-break`
- `/brudo-fwocr`

or by any of the trigger phrases listed in their descriptions. They load on demand exactly like your other Brudo skills.

## Optional next steps (if you want more)

Because the request was “make new skills from my existing skills,” the three incomplete stubs were the highest-priority, most natural targets. Additional high-value derivatives that could be spun out of the same corpus include:

- A pure **Breath-Year** accounting skill (orthogonal to FWOCR).
- A **Closed-Loop Map Interrogation** specialist that can be called independently of any domain.

- A **claim-ladder + HER audit** micro-skill for rapid pre-flight checks on any text.
- Cross-domain skills that combine lexical-pressure detection with the  
LEGAL\_FILING\_ATLAS or MECHANISTIC\_RENDERING work panels.

Tell me which (if any) of those you want next, or paste any other incomplete / desired skill and we will continue under the same skill-creator discipline.

All three new skills are live on disk and ready for use.
