

Skill Creator — additional skills delivered.

I analyzed the attached `grok_skills_archive_00.zip` (17 image-based jsPDF reports of prior Skill Creator / Brudo operating-status sessions). OCR of the reports shows:

- The current 21-skill Brudo stack (Executive / Epistemic-pressure / Structure / Domain) is already mature.
- The three skills completed in the previous turn (promotion-asymmetry, coordinate-class-break, fwocr) + the respiratory consolidation are explicitly recorded as done in the latest report.
- One high-value item remained **queued but never turned into a persistent skill**: the full Semiconductor Supply Chain research campaign package.
- A clean orthogonal specialist was still missing from the respiratory accounting family: the pure **Breath-Year** horizon (complementary to the FWOCR ledger).

I therefore created two new skills by the same disciplined derivation process used last turn (extract from existing mature skills + archive material → specialized front-matter + body → validate).

1. `/brudo-semiconductor-supply-chain` (new)

Description

Specialized research campaign skill for semiconductor supply chains manufacturing dependencies and national technology capacity. Enforce process-node materials equipment packaging workforce logistics distinctions and non-collapse rules. Trigger on semiconductor supply chain, chips act, foundry capacity, ASML, TSMC, process node, CHIPS Act, NSTC, OSAT packaging, wafer fab, yield, or when launching a parallel research mission distinct from CI resilience LRD or `LEGAL_FILING_ATLAS`.

Source material

- The fully specified `BRUDO_SEMICONDUCTOR_SUPPLY_CHAIN_RESEARCH_CAMPAIGN_V1` package that appears in the archive (campaign_id, governing rules, 5 execution waves, 4 workstreams PROC/TOOLMAT/POLICY/CAPRISK, prioritized 10-item launch queue SSC-001...SSC-010, independent lineages, failure conditions).

- Parent contract from `brudo-campaign-package`.
- Non-collapse and custody rules from `brudo-lexitek`, `brudo-source-custody`, and the parallel `critical-infrastructure-cyber-resilience` skill (kept strictly distinct).

Key content

Mandatory governing rules (never treat funding as capacity, never equate node labels across firms, separate wafer-fab from packaging/OSAT, surface CAPACITY_DATA_INCOMPLETE / YIELD_UNVERIFIED tags, etc.), full launch-queue discipline, domain-specific independent lineages, JSON status contract that extends the campaign-package schema, and explicit anti-patterns against category collapse.

Validation: OK (104 lines).

2. `/brudo-breath-year` (new)

Description

Apply the Breath-Year as the master cumulative accounting horizon for respiratory adaptation under Hannah's Law. Track long-horizon work load recovery and capacity change on the Conditioning Tree without collapsing to single-session or population-average metrics. Trigger on Breath-Year, cumulative respiratory accounting, long-horizon adaptation, Breath Year horizon, or when quantifying multi-session or multi-month airway work savings or load relative to FWOGR.

Source material

- Ontology and accounting definitions from `brudo-respiratory-adaptation` / the (now-deprecated) `respiratory-adaptation-canon`.
- Complementary relationship to the `brudo-fwocr` ledger we completed previously (FWOCR supplies the burden-decomposition entries; Breath-Year is the horizon that accumulates them).

Key content

Clear separation of horizon vs ledger, rules that reject single-snapshot or population-average substitution, claim-ladder + HER requirements, JSON output contract that links FWOGR entries into a cumulative view, and anti-patterns against ordinary sleep-medicine framing.

Validation: OK (61 lines).

Current specialized accounting triad (respiratory)

- `brudo-breath-year` — the cumulative horizon
- `brudo-fwocr` — the burden-decomposition ledger that fills the horizon
- Progressive Overload of airway tissues remains inside the parent `brudo-respiratory-adaptation` kernel

How to use the new skills

Simply invoke:

- `/brudo-semiconductor-supply-chain`
- `/brudo-breath-year`

or any of the trigger phrases listed in their descriptions. They load on demand, inherit the supporting machinery (claim ladder, HER, source-custody, campaign-package contracts, authorized-initiative, etc.) from the parent skills, and emit the same style of machine-usable JSON objects already used by the rest of the stack.

Notes on the archive itself

The 17 reports form a useful historical record of how the skill stack was built. No additional incomplete TODO stubs remain. The semiconductor campaign was the clearest “queued but not yet skill-ified” item; Breath-Year was the cleanest missing specialist that completes a natural triad.

If you want further skills (for example a pure `archive-ingest` / `status-from-reports` skill that can process successive `CODEBASE_INTERFACE` or `grok_report` archives, additional domain campaigns, or further micro-specialists), just say the word or attach the next source material. Both new skills are live on disk and ready.
