

## **Skill Creator — two more skills delivered.**

The stack is now mature (26 skills). No remaining TODO stubs. The previous turn closed the last pure placeholders and the most obvious queued campaign (semiconductor).

From the same archive of prior skill-creator reports + the existing respiratory and operating-status families, two additional high-leverage specializations were extracted and written:

### **1. /brudo-archive-ingest (new)**

#### **Description**

Fail-closed ingestion of successive Brudo archives CODEBASE\_INTERFACE logs and grok\_report style skill-creator reports into unified operating-status objects. Enforce non-collapse of neighboring maps authorized initiative and semantic gates. Trigger on archive ingest, report status, CODEBASE\_INTERFACE, grok\_report, brudo zip unification, successive snapshots, or when turning historical skill reports or interface logs into current operating status.

#### **Why this one**

The 17-report archive you attached (and the repeated pattern across earlier sessions) shows continuous need for exactly this capability: take successive snapshots / OCR'd reports / interface logs and produce a single fail-closed, initiative-aware operating-status object without silent aliasing, map collapse, or invented pause conditions.

#### **Derived from**

brudo-operating-status , brudo-authorized-initiative , brudo-work-panel , brudo-source-custody , and the concrete unification patterns visible in the OCR'd reports themselves.

Validation: OK (52 lines).

### **2. /brudo-progressive-overload-airway (new)**

#### **Description**

Progressive Overload applied to airway tissues under the Respiratory Adaptation Canon. Require intensity frequency recovery and measurable tissue or function change. Separate external support from internal adaptation. Trigger on progressive overload throat. airway

external support from internal adaptation trigger on progressive overload threat, airway training stimulus, intrapharyngeal Valsalva as training, support versus adaptation, or when claims treat devices or maneuvers as tissue strengthening without evidence.

Why this one

Completes the natural respiratory accounting/mechanism triad that began with the previous turn:

- brudo-breath-year — the cumulative **horizon**
- brudo-fwocr — the **ledger** that fills the horizon
- brudo-progressive-overload-airway — the **mechanism** that generates the load being accounted for

Derived from

The Progressive Overload section + non-collapse rules already present in brudo-respiratory-adaptation (intensity / frequency / recovery / measurable tissue change; support ≠ adaptation; throat-extension claims under the same discipline).

Validation: OK (54 lines).

Current respiratory mechanism set (now fully specialized)

| Skill                             | Role                                                                        |
|-----------------------------------|-----------------------------------------------------------------------------|
| brudo-breath-year                 | Cumulative accounting horizon                                               |
| brudo-fwocr                       | Burden-decomposition ledger                                                 |
| brudo-progressive-overload-airway | Training stimulus / load mechanism                                          |
| brudo-respiratory-adaptation      | Parent domain kernel (ontology + claim ladder + HER + late-bound symbolism) |

How to use

Invoke directly:

- /brudo-archive-ingest
- /brudo-progressive-overload-airway

or by one of the trigger phrases in their descriptions. Both inherit the full supporting

or by any of the trigger phrases in their descriptions. Both inherit the full supporting machinery (claim ladder, HER, source custody, authorized initiative, non-collapse rules, etc.) from the parent skills and emit the same style of machine-usable JSON already used across the stack.

The progressive-specialization pattern continues cleanly: every new skill is a tight extraction from material that already existed in the corpus or the attached reports. No invented knowledge, no duplication of model defaults, no remaining TODOs.

If you want still more (another domain campaign, a pure closed-loop micro-skill, further self-discovery assay specialists, a climate-CRP parallel, etc.), just say “more” or point at the next source material. Both new skills are live and ready.
