

Skill Creator — gap filled from the supplied deep research workplan template.

The large `deep_research_workplan.v1` JSON you provided is a complete, high-quality, domain-agnostic multi-month research program template (28 weeks, 6 phases, 35 dependency-ordered tasks, gates, roles, budgets, methods matrix, risks, ethics, tooling, visualizations, and handoff plan).

Concrete gap identified

The Brudo stack already had:

- `brudo-campaign-package` — reusable campaign contracts for bounded research missions
- specialist domain campaigns (semiconductor, critical-infrastructure-cyber-resilience)
- source-custody, evidence-ranking, HER, work-panel, authorized-initiative, operating-status

What was missing was a first-class skill that operationalizes a **full multi-month, dependency-ordered, gated research program** at the scale and rigor of the template you supplied (charter → ontology → evidence rubric → source map → rights review → pipelines → primary research → validation → synthesis → handoff).

New skill created

`/brudo-deep-research-program`

Description

Execute and adapt the `deep_research_workplan.v1` multi-month domain-agnostic research program template. Enforce primary-source-first, observation-vs-inference separation, versioning, ethics gating, dependency order, and handoff discipline. Trigger on deep research program, research workplan, multi-month research plan, program charter, evidence grading rubric, source map, or when launching a full research program from the `deep_research_workplan` template.

What it embeds and enforces

- Full phase structure (PH-00 through PH-05)

- Critical path and gating decisions (G-01 rights, G-02 question lock, G-03 publish-only-survivors)
- Operating principles (primary sources first, observation $\neq$ inference $\neq$ recommendation, preserve negatives/contradictions, version everything, ethics as gate)
- Adaptation rules for DOMAIN / ENTITY / SYSTEM / OUTCOME placeholders
- Integration points with existing skills (campaign-package, source-custody, evidence-ranking, HER-claim-audit, work-panel, authorized-initiative, operating-status, return-gate)
- Acceptance tests, contradiction register discipline, and handoff/maintenance requirements

Validation: OK (80 lines). The full original template structure is retained as the contract the skill adapts and executes against.

How to use

Invoke `/brudo-deep-research-program` (or any of the trigger phrases) and supply a concrete DOMAIN (or leave it as a template instantiation). The skill will:

1. Load the template contract
2. Specialize ontology, source map, and question matrix for the domain
3. Enforce the dependency order and gates
4. Emit status objects trackable by `brudo-operating-status` and `brudo-work-panel`
5. Preserve the evidence classes, contradiction register, and handoff package requirements

This continues the same progressive-extraction pattern used throughout the conversation: take high-quality existing material (now the workplan template) and turn the missing operational capability into a first-class, invocable Brudo skill.

No remaining TODO stubs. The stack now covers both lightweight campaign contracts and full multi-month program execution.

Ready for the next concrete gap or domain specialization.
