

Skill Creator — more skills extracted from the deep research workplan template.

The `deep_research_workplan.v1` template still contained several high-value internal disciplines that were only partially covered by the top-level `brudo-deep-research-program` skill and the existing epistemic stack. Three concrete, modular specialists have now been extracted and made first-class:

1. `/brudo-contradiction-register`

Description

Maintain a living contradiction register and issue log for Brudo research programs. Log conflicting claims null results unresolved questions with source IDs dates status and resolution rationale. Trigger on contradiction register, issue log, conflicting claims, null result, unresolved contradiction, or when preserving negatives and open conflicts across literature data interviews or analysis workstreams.

Gap filled

The template repeatedly requires preservation of negative findings, null results, and open conflicts (T-016, T-028, D-09, operating principles). This was previously only implicit inside campaign-package and synthesis steps. The new skill makes the register a recoverable, source-linked work object with explicit status values (OPEN / TRIAGED / RESOLVED / DOWNGRADED / LEFT_UNRESOLVED) and forces unresolved items to remain visible at handoff.

Validation: OK.

2. `/brudo-research-handoff`

Description

Produce the handoff and maintenance package for Brudo research programs. Generate runbook ownership matrix maintenance cadence next-quarter backlog and sunset rules so the work remains usable after the initial program ends. Trigger on research handoff, maintenance package, program handoff, runbook, ownership assignment, or when closing a multi-month research effort with reproducible transfer.

Gap filled

T-035 / D-11 and the entire `handoff_and_maintenance_plan` section of the template define

a full transfer package (runbook, ownership matrix, monthly/quarterly cadence, sunset rules). No prior skill enforced this as a first-class deliverable. The new skill produces the complete package so a successor team can continue without reconstructing core assumptions.

Validation: OK.

3. /brudo-evidence-grading-rubric

Description

Apply the evidence grading rubric and confidence-tiering system for Brudo research. Score claims by evidence class inter-rater consistency and confidence tier. Trigger on evidence grading rubric, confidence tier, inter-rater agreement, claim scoring, high medium low speculative unresolved, or when findings must be labeled by evidence strength before synthesis or publication.

Gap filled

T-004 / D-03 and the confidence-tier step (T-030) require a formal rubric with inter-rater checks and explicit tiers (high / medium / low / speculative / unresolved) tied to the four source-priority tiers. This was only partially covered by the existing claim ladder and evidence-ranking skill. The new skill makes scoring, inter-rater discipline, and tier assignment mandatory before synthesis or publication gates.

Validation: OK.

Resulting coverage of the template

Template module	Status
Full program structure, phases, gates, critical path	brudo-deep-research-program
Contradiction / null-results preservation	brudo-contradiction-register (new)
Handoff, ownership, maintenance, sunset	brudo-research-handoff (new)
Evidence grading + confidence tiers + inter-rater	brudo-evidence-grading-rubric (new)
Source priority framework, claim typing, custody	already covered by existing skills

All three skills follow the house style, integrate with the deep-research-program parent and the epistemic stack (claim, register, how, claim, audit, source, custody, evidence, ranking,

the epistemic stack (claim-registry, ner-claim-audit, source-custody, evidence-ranking, return-gate), and emit machine-usable JSON objects.

They are live and ready. Invoke with `/brudo-contradiction-register` , `/brudo-research-handoff` , or `/brudo-evidence-grading-rubric` (or any of their trigger phrases).

The progressive extraction of the template's strongest internal disciplines is now complete. Further modules (methods matrix, visualization standards, team-roles matrix, etc.) remain available if you want still more.
