

Skill Creator — continuing progressive extraction.

Three additional concrete specialists have been extracted from the remaining dense modules of the `deep_research_workplan.v1` template and made first-class:

1. /brudo-source-priority-framework

Description

Enforce the four-tier source priority framework for Brudo research. Rank sources as primary official, authoritative secondary, expert interviews, or industry commentary and require authority scoring and minimum metadata fields. Trigger on source priority framework, authority ranking, source tier, primary official sources, authoritative secondary, or when ranking sources before claim elevation or synthesis.

What it adds

The explicit 4-tier ranking (Primary/official → Authoritative secondary → Expert interviews → Industry/media) plus the minimum fields required for every source record. Prevents Tier-4 commentary from silently supporting core claims and forces `authority_tier` + `limitations` + `update_cadence` to be present.

Validation: OK.

2. /brudo-research-methods-matrix

Description

Operationalize the research methods matrix for Brudo programs. Select and execute structured literature review comparative case studies interviews experiments modeling and adversarial review with their defined inputs outputs and common risks. Trigger on research methods matrix, structured literature review, comparative case studies, adversarial review, methods selection, or when choosing and governing empirical methods inside a deep research program.

What it adds

Makes method selection deliberate. Every analysis workstream must declare its method, inputs, outputs, and the common risks listed in the template (selection bias, anecdotal overreach, assumption stacking, confirmation bias, etc.) together with the mitigations that will be used.

Validation: OK.

3. /brudo-research-ethics-gate

Description

(Already present and validated in the concurrent write.) Hard G-01 ethics / privacy / legal / data-rights gate with the required policy artifacts (data classification matrix, retention schedule, access-control matrix, interview consent SOP, publication review checklist). Treats ethics as a gating decision, not cleanup.

Current coverage of the deep research template

Template module	Skill
Full program structure, phases, gates, critical path	brudo-deep-research-program
Contradiction / null-results preservation	brudo-contradiction-register
Handoff / ownership / maintenance / sunset	brudo-research-handoff
Evidence grading + confidence tiers	brudo-evidence-grading-rubric
4-tier source priority + minimum fields	brudo-source-priority-framework (new)
Methods matrix + risks	brudo-research-methods-matrix (new)
Ethics / privacy / data-rights gating	brudo-research-ethics-gate (new)

The major internal disciplines of the template are now first-class, invocable skills that integrate with the rest of the Brudo stack (source-custody, claim-registry, HER, return-gate, operating-status, authorized-initiative, etc.).

Total skills ≈ 43. Zero TODOs.

Invoke the new ones with /brudo-source-priority-framework , /brudo-research-methods-matrix , or /brudo-research-ethics-gate (or any of their trigger phrases). Further residual modules (program-risk register, seed-bibliography strategy, visualization / Gantt standards, roles-and-effort matrix) remain available if you want to keep going.
