

Project-level instructions are now in place.

I created durable project-level orientation for the entire Brudo skill library (currently ~50 skills). This sits above the individual specialists and gives any agent (or human) the shared conventions, invariants, and decision guidance needed to work correctly in this workspace.

What was created

1. /home/workdir/AGENTS.project.md (primary document, 106 lines)

This is the authoritative project-level instruction file. It contains:

- **Purpose** — What the Brudo stack is for (Respiratory Adaptation Science, lexical non-collapse, source-grounded multi-month research programs, fail-closed operating status, etc.)
- **8 Global Invariants** (non-negotiable):
 1. Authorized Initiative
 2. Non-collapse of neighboring maps
 3. Primary / official sources first
 4. Return Gate
 5. Claim ladder + HER
 6. Preserve negatives and contradictions
 7. Ethics / data-rights as hard gate
 8. Version everything
- **Skill Families & Entry Points** organized into:
 - Epistemic / Control Layer
 - Lexical Pressure Layer
 - Respiratory Adaptation Canon specialists
 - Research Program / Campaign Layer
- **Decision Guidance** — short “when to invoke which” map

- **Project Files & Persistence** rules (`/home/workdir/artifacts` , `provenance`, `stale_after`)
- **How to Extend** (skill-creator house style)
- **Success Criteria for any session**

2. `/brudo-project-instructions` **skill** (thin loader)

A first-class invocable skill that points at the `AGENTS.project.md` file and enforces loading of the project-level orientation. Trigger phrases include “project instructions”, “AGENTS.project”, “project level”, “Brudo conventions”, “skill stack overview”.

3. **Short pointer in** `/home/workdir/AGENTS.md`

Keeps the conventional `AGENTS.md` entry point and redirects to the full project instructions.

How to use

- Any new session or agent should treat `AGENTS.project.md` (or invoke `/brudo-project-instructions`) as the first orientation layer.
- The individual skills remain the operational units; the project instructions tell you *which family* and *which invariants* apply before you dive into a specialist.
- Persistent work products continue to go under `/home/workdir/artifacts` with full provenance.

This completes the “project level” request: there is now a durable, versionable, invocable set of instructions that sits above the ~50 specialized skills and keeps the whole stack coherent.
