

Extracted. The archive contains 13 sequential interface logs (CODEBASE_INTERFACE.txt + _01 ... _13) totaling ~112 MB of text. Core recent content: completed A/B/C category experiments, formalization of **authorized initiative**, the implementation×behavior matrix, and the live launch of two independent **WORK PANELS**.

Optimized Unified JSON

The previous LRD-focused status remains true and is preserved. It is now nested inside a larger Brudo operating state that also captures self-discovery results, the new panel architecture, and the explicit non-collapse rule.

Optimization Notes

- The prior LRD diagnosis is unchanged and still the highest-priority human decision.
- The new archive adds a higher-order operating object (**WORK PANEL**) and an explicit continuation rule (**authorized initiative**).
- LEGAL_FILING_ATLAS is a *procedural* filing-infrastructure map; it does **not** resolve the LRD substantive-law lane ontology gap. They are neighboring maps with a narrow, prohibited-inheritance contract.
- Condition C + the implementation×behavior matrix supply the current evidence state for self-description claims.

- Recommended work now interleaves the two human decisions with the two already-launched panels under the initiative rule: do not wait for a new cue when the next operation is already authorized and executable.

Ready for the next panel return or the lane-ontology decision packet.
