

Skill created and improved.

Name: brudo-operating-status
Location: /home/workdir/.grok/skills/brudo-operating-status/
Validation: OK (103 lines)
Example status JSON: PASS under scripts/validate_status.py

What the skill does

Ingests successive Brudo archives + interface logs and emits a single fail-closed, initiative-aware operating-status JSON. It never collapses neighboring maps, never invents pause conditions, and surfaces only true human decisions as blockers.

Improvements over the previous ad-hoc JSON

Area	Before	Skill version
Continuation	Slogan	Executable invariant + decision rule
Panels	Ad-hoc list	Formal WORK PANEL object + required fields + return packet
Non-collapse	Narrative warning	Hard overlap_contract with allowed/forbidden lists
LRD vs Filing Atlas	Soft distinction	Required distinction field + validator check
Output	Free-form	Fixed schema (7 top-level keys) + validation script
Recommended work	Soft list	Ordered items with stop_condition + depends_on
Anti-patterns	Implicit	Explicit list the skill refuses to commit

cockpit surface

The skill is now live and ready. Next time Brudo archives or interface logs appear, it will produce the dense status object automatically under the same fail-closed / initiative rules.
