Validation: OK (101 lines) · example lexicon PASS

What it is

A closed, **executable** lexical technology that compresses everything prior into 12 named objects. Downstream skills load this lexicon instead of inventing vocabulary.

Term	Kind	Executable role
AUTHORIZED_INITIATIVE	decision procedure	Act when purpose + authority + next op are clear; never invent pauses
WORK_PANEL	native object	Recoverable bounded operation with required fields
OVERLAP_CONTRACT	constraint	allowed[] / forbidden[] only; no silent inheritance
EVIDENCE_TAG	enum	OBSERVED · COMMISSIONED · INFERRED · UNTESTED · FAILED_IN_PRIOR_FIXTURE
MAP_KIND	enum	SUBSTANTIVE_LAW · PROCEDURAL_INFRASTRUCTURE · PHYSICAL_MODEL · RESEARCH_CAMPAIN · SELF_DISCOVERY
STATUS	enum	Native lifecycle values only (never ACCEPTED = INTEGRATED)
OPERATION_TYPE	enum	Native + HUMAN_DECISION_REQUIRED · PANEL_RETURN · EXECUTE
STOP_CONDITION	required field	Every recommended item must end on a testable condition
SEMANTIC_GATE	hard gate	BLOCKED_BY_SEMANTIC_MISMATCH cannot be auto-resolved
PACKAGE_CONTRACT	research schema	Required artifacts + source/claim/measurement fields + lineages
FAILURE_CONDITION	rejection rule	Funding ≠ capacity; plan ≠ implementation; node label ≠ process equivalence

NON_COLLAPSE

meta-rule

Neighboring MAP_KINDs stay distinct unless explicitly contracted

What it summarizes

- Authorized initiative + fail-closed operating status
- WORK PANEL + overlap contracts (MECHANISTIC_RENDERING · LEGAL_FILING_ATLAS)
- LRD semantic gate (BLOCKED_BY_SEMANTIC_MISMATCH)
- Research campaign package contracts (CI resilience · Semiconductor SSC)
- Evidence tags and implementation ≠ proof
- Program failure conditions that reject category collapse

The skill is now the single controlled vocabulary both `brudo-operating-status` and future campaign skills can load.
